AMENDMENTS TO THE CLAIMS

Claims 1-23 (Canceled)

Claim 24 (Currently Amended): A method <u>performed by a machine</u> comprising:

receiving a user password;

receiving a name of an <u>independent software</u> application <u>that</u> requiringes a password <u>for a user to use the software application</u>;

determining a correct-specific salt value for associated with the software application;

computing an <u>software</u> application dependent password for a user, wherein the <u>software</u> application dependent password depends on the user password and the salt value for the <u>software</u> application; and

returning the $\underline{software}$ application dependent password to the $\underline{software}$ application.

Claim 25 (Currently Amended): The method of claim 24, wherein the computing of the <u>software</u> application dependent password depends on a user name.

Claim 26 (Currently Amended): The method of claim 25, wherein the computation of the <u>software</u> application dependent password further includes hashing the user name, the user password, and the salt value for the <u>software</u> application.

Claim 27 (Currently Amended): The method of claim 25, further comprising retrieving generating an old password if the old password is required.

Claim 28 (Currently Amended): The method of claim 25, wherein a strong password is used to generate a plurality of <u>software</u> application passwords.

Claim 29 (Currently Amended): The method of claim 24, wherein the salt value is unique for a user and an <u>software</u> application.

Claim 30 (Currently Amended): A method <u>performed by a machine</u> comprising:

generating a hash from a <u>particular</u> salt value <u>associated with a specific</u> <u>software application</u> and input data;

generating a password from the hash; and returning the password to an the software application application to gain entry to the software application.

Claim 31 (Previously Presented): The method of claim 30, further comprising: receiving the input data;

determining if the salt value exists;

generating the salt value and storing the salt value in a table entry if the salt value does not exist; and

retrieving the salt value from the table entry if the salt value exists.

Claim 32 (Previously Presented): The method of claim 30, wherein the input data comprises a user identification and a strong password.

Claim 33 (Currently Amended): The method of claim 32, wherein the input data further comprises an <u>software</u> application identification.

Claim 34 (Previously Presented): The method of claim 32, further comprising determining if a new strong password is required; and

retrieving the new strong password if the new strong password is required.

Claim 35 (Currently Amended): The method of claim 32, wherein the strong password is used to generate a plurality of <u>software</u> application passwords.

Claim 36 (Previously Presented): The method of claim 30, wherein the salt value is one of predetermined and generated by a random number generator.

Claim 37 (Currently Amended): The method of claim 30, wherein the salt value and the <u>software</u> application are associated in the table entry.

Claim 38 (Currently Amended): The method of claim 30, wherein the <u>software</u> application is run on one of a local computer system and a networked computer system.

Claim 39 (Previously Presented): The method of claim 30, wherein one of a secure hash algorithm (SHA-1) and a message digest (MD5) algorithm are used to generate the hash.

Claim 40 (Previously Presented): The method of claim 30, wherein the generated password is temporarily stored in a memory for a predetermined time period.

Claim 41 (Previously Presented): The method of claim 40, wherein the predetermined time period is based on platform activity.

Claim 42 (Previously Presented): The method of claim 41, wherein the platform is one of a local computer system and a networked computer system.

Claim 43 (Currently Amended): A program storage device readable by a machine comprising instructions that cause the machine to:

generate a hash from a <u>particular</u> salt value <u>associated with a specific</u> <u>software application</u> and input data;

generate a password from the hash; and

return the password to anthe software application to gain entry to the software application.

Claim 44 (Previously Presented): The program storage device of claim 43, further comprises instructions that cause the machine to:

receive input data;

determine if a salt value exists;

generate a salt value and store the salt value in a table entry if the salt value does not exist; and

retrieve the salt value from the table entry if the salt value exists;

Claim 45 (Previously Presented): The program storage device of claim 43, wherein the input data comprises a user identification and a strong password.

Claim 46 (Currently Amended): The program storage device of claim 45, wherein the input data further comprises an <u>software</u> application identification.

Claim 47 (Previously Presented): The program storage device of claim 43, further comprises instructions that cause the machine to:

determine if a new strong password is required; and retrieve the new strong password if the new strong password is required.

Claim 48 (Currently Amended): The program storage device of claim 47, wherein the strong password is used by the machine to generate a plurality of <u>software</u> application passwords.

Claim 49 (Previously Presented): The program storage device of claim 43, wherein the salt value is one of predetermined and generated by a random number generator.

Claim 50 (Currently Amended): The program storage device of claim 43, wherein the salt value and the <u>software</u> application are associated in the table entry.

Claim 51 (Previously Presented): The program storage device of claim 43, wherein one of a secure hash algorithm (SHA-1) and a message digest (MD5) algorithm are used in instructions to cause the machine to generate the hash.

Claim 52 (Previously Presented): The program storage device of claim 43, wherein the generated password is temporarily stored in a memory for a predetermined time period.

Claim 53 (Previously Presented): The program storage device of claim 52, wherein the predetermined time period is based on platform activity.

Claim 54 (Previously Presented): The program storage device of claim 52, wherein the platform is one of a local computer system and a networked computer system.
